WEB SERVICES

Web services are created to allow Enterprise users to share data with third party applications such as accounting, inventory or inside sales software.

We have developed what we consider the most requested ones web services to get sales orders, new products, new clients and inventory from the cloud server and send new products, inventory and new clients to the cloud server all in XML format

Once the cloud server gets the new data, mobile devices can sync to receive it as well.

To integrate each web service with your current software you might need an IT person who will be responsible for using this tool appropriately and developing the interface.

Web Services access and validation: Every access requires authentication via secured socket layer and since the administrator of the Enterprise account can grant or not access to these services, you should use only enabled users to access the web services.
